/note="Tector: DT713D=Pac (Pharmacia) with a modified
polylinker; Site_l: Not_l; Site_2: Eco_R!; The
NIH_BMAP_M S3.1 [library is a subtracted library of a
series ultimately derived from a mixture of individually
tagged normalized libraries from ten regions of the mouse
brain (cerbellum, brain stems, olfactory bulbs,
hypothalamus, cortex, amydglala, basal ganglia, pineal
gland, striatum, hipoccampus) after a series of
subtractions to reduce the representation of cDNAs from
which ESTs had already been generated in this
process: NIH_BMAP_M S3.1, NIH_BMAP_M S3.1 was constructed
as follows: Poramplified cDNA inserts from NIH_BMAP_M S2
clones from which 33.1; NIH_BMAP_M S3.1) was constructed
as follows: Poramplified cDNA inserts from NIH_BMAP_M S2
clones from which 3' ESTs had been derived was used as a
driver in a hybridization with the NIH_BMAP_M S2 library
in the form of single-stranded circles (subtracted library) was purified
by hydroxyapatite column chromatography, converted to
double-stranded circles and electroporated into DH10B
bacteria (LifeTeChnologies) to generate the
NIH_BMAP_M S3.1 library. This procedure has been
previously described (Bonaldo, Lennon and Soares, Genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CD774674 110-0-101.81 NIH EMAP MHI Mus musculus cDNA clone UL-M-AQ0-cit-k-14-0-UI 3', mRNA sequence.

Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It
should be noted that Bento Soares is generating a small number of
additional specialized non-redundant arrays of BMAP cDNAs whose
availability will be considered under appropriate and limited
collaborative arrangements

/note="Vector: pBe108AC11; Site 1: HindIII; Rice is one of two most popular grains in the world Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36,664 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent

Intramural Research Evergam, NIH (http://lgsun.grc.mia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were obtained from Dr. Janet Rossant and Tilo Kunath (Samuel Lunenfeld Research Institute, Canada). Double-stranded contact was synthesized with an Oligo(dT) primer

polylinker; Site 1: Not 1; Site 2: Ecc RI; The
NIH BMAP MHI library is a non-normalized library
conscructed from mouse hippocampus. The tag is a string
conscructed from mouse hippocampus. The tag is a string
of 5 nuclectides present between the Not I site and the
oligo-dT track. The library was constructed as described
by Bonaldo, Lennon and Soares, Genome Research 6:
791-806, 1996. Tissue provided by Ms. Annie Novakovich,
zivic_Miller Laboratories.

/ione lib="Nih Mouse 15% CDNA Clone Set"
/clone in among a rearrayed set of 15,247 clones from 11 clones from 12 clones from 13 clones from 13 clones from 13 clones from 13 clones from 14 clones from 14 clones from 15 clones from 15 clones from 15 clones from unfertilized egg to blastocyst, embryonic part of E7.5 embryos. extraembryonic part of E7.5 embryos.

Part of E7.5 embryos, extraembryonic part of E7.5 embryos, and E12.5 female mesonephros/gonad) and one newborn ovary cDNA library. Average insert size 1.5 kb. All source libraries are cloned unidirectionally with Oligo (dT)-Not primers. /clone lib="Organ: Vector: pVX-Asc; Site_1: BcoR I;
Site_2: Not I; The library was constructed_according to
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mXNa was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
cDNA was size selected according to mRNA size fraction,
ligated with EcoR I adaptor, digested with Not I, and then
cloned directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyh
tail, is CAGCCACGAC. This library was created for the
University of Iowa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery in the Developing Mouse Nervous
System', supported by National Institute of Mental Health
(NIMH), Hemin Chin, Ph.D., program coordinator."

//note="Organ: Brain; Vector: pyx- Asc; Site 1: EcoR I;
Site 2: Not I; The library was constructed according
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel: First strand cDNA synthesis was primed with oligo-dr
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with NotI and then cloned
directionally into pix-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is TGAGAGAGCC. This library was created for the University
lowa Brain Anatomy Project (BMAP): 'dene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,
program coordinator."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN.

Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer 15' AGAGAGAGAAGAAGACTATTTTTTTTTTTTTVT 3', cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 7.5 and subtraction to fe sequence [5' Second strand cDNA was prepared with the primer adapter of sequence [5').
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GAGAGAGAGATTCTCGAGTTAATTAATCCCCCCCCCCC 3']. cDNA was cleaved with XhoI and SstI. Cloning sites, 5' end: XhoI; 3' end: SstI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /tissue_type="whole body"

L0-704T3 Ice plant Lambda Uni-Zap XR expression library, 0 hours
MCGL treatment Nesembryanthemum crystallinum cDNA clone L0-704 5'
similar to Chlorophyll a/b-binding protein type I precursor
(AL049488) [Arabidopsis thaliana], mRNA sequence.
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Caryophyllales; Aizoaceae; Mesembryanthemum.

I. (bases 1 to 559)

Cushman, J.C.

An expressed sequence tag database for the common ice plant, mesembryanthemum crystallinum

Primer useful for familial dysautonomia allele genotype analysis. Familial dysautonomia; Riley-Day syndrome; hereditary sensory neuropathy III; human; carrier; diagnosis; IkappaB kinase-complex associated protein; primer; SSCP; single-strand conformational polymorphism; ss.

17-JAN-2001; 2001US-0262284P.

WPI; 2002-601228/65.

Detecting a polymorphism in a gene encoding the lkappaB kinase-complex-associated protein is used to diagnose and identify carriers of familial dysautonomia.

Claim 7; Page 10; 16pp; English.

(GEHO) GEN HOSPITAL CORP.

```
The invention provides a method for detecting a polymorphism linked to a disruptive mutation in a gene encoding the IkappaB kinase-complex.

a disruptive mutation in a gene encoding the IkappaB kinase-complex.

associated protein (IKAP) on chromosomes with the major FD haplotype, a crost complex.

IKAP-encoding gene showed in chromosomes with the major FD haplotype, a crost common minor haplotype in chromosomes with the generation of an IKAP mRNA in which exon 20 is spliced out along with intron 20. Sequence analysis of the IKAP gene of individuals heterozygous for the FC promosome with the most common minor haplotype (minor 2) showed a G to C transversion of most common minor haplotype (minor 2) showed a G to C transversion of most common minor haplotype (minor 2) showed a G to C transversion of the IKAP gene of individuals heterozygous for the FC primers that can be most common minor haplotype (minor 2) showed a G to C transversion of the regonetide 2390 in exon 19 of the reported IKAP CDNA, resulting in an Arg696Pro aminor acid substitution and disruption of a consensus Ser/hr kinase phosphorylation site. The present sequence is a primer that can be used in the genetype analysis of FD alleles. Use with the gene, using single-strand conformational polymorphism (SSCP) analysis.

The primer diven in ABN84786 yielded a 238 bp fragment. In a family with the probands homozygous for the major haplotype, all affected individuals of the parents were homozygous for the major major FD haplotype showed that 100% of the parents were homozygous for the major FD haplotype showed that 100% of the probands were homozygous for the major FD haplotype and the 2507+6T to C and 21 probands here homozygous for the major FD haplotype and the probands were homozygous for the proband were heterozygous for the probands were homozygous for the probands were homozygous for the probands were homozygous for the FD haplotype and the 2507+6T to C and 2 individuals with R696P constitution, and 4 siblings of the probands reperture and the 250
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day electing mutations which cause Familial Dysautonomia (FD, Riley-Day syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIN 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565) are associated with FD. The mutation associated with the major haplotype of FD, mutation, where the thymine cof FD, FDI mutation, is a base pair (bp) mutation, where the thymine corrected this results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type corrected at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation, is a bp mutation, where the guanthe conclotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation causes an arginine to proline missense mutation (R696P) in the IYBKAP protein, which is predicted to disrupt a potential concloting a subject with FD and for rapid carrier screening. The IXBKAP can end maps to chromosome 991. Note: the present sequence was not shown in the specification, but was derived from the contains wild-type IXBKAP sequence given in Fig 6
                                                            New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or prenatal diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; IKBKAP; Familial Dysautonomia; FD; Riley-Day syndrome;

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565) are associated with FD. The mutation associated with the major haplotype of FD, FDI mutation, is a base pair (bp) mutation, where the thymine of nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type rD2 mutation, is ab mutation, where the guanine miscense mutation (R696P) in the IKBKAP protein, which is predicted to disrupt a potential consess an arginine to proline miscense mutation (R696P) in the IKBKAP protein, which is predicted to disrupt a potential consess an autylent with FD and for rapid services are useful for identifying a subject with FD and for rapid sarrier screening. The IKBKAP contains 37 exons and maps to chromosome 9911. Note: the present sequence was not shown in the specification, but was derived from the contains wild-type IKBKAP sequence given in Fig 6
                                                                   New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; IKBKAP; Familial Dysautonomia; FD; Riley-Day syndrome;

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Sundrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM 223900]. It was found that mutations in the IXBKAP gene (the present sequence) are associated with FD. The mutation associated with the major complete or the FD. The mutation is a base pair (bp) mutation, where the chymine nucleotide located at bp 6 of introm 20 in the IXBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA completype message in a tissue-specific manner. The mutation where the with the minor haplotype, FD2 mutation, is a bp mutation associated with the minor haplotype, FD2 mutation, is a bp mutation where the cytosine. This bp mutation causes an arginine to proline missense mutation (R656P) in the IXBKAP protein, which is predicted to disrupt a contential phosphorylation site. The IXBKAP nucleic acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IXBKAP gene contains 37 exons and maps to chromosome 9931
                         New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or prenatal diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 66479 BP; 18271 A; 12398 C; 14129 G; 21681 T; 0 U; 0 Other;

Riley-Day detecting mutations which cause Familial Dysauconamia (Fp. Riley-Day Spacory and Autonomia Neuropathy Type III) [OMIN 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565) are associated with Fp. The mutation associated with the major haplotype of Fp. FDI mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type message in a tissue-specific manner. The mutation associated with the much containe, by mutation, is a bp mutation, where the granaine. This bp mutation causes an arginine to proline missense mutation (R696P) in the IKBKAP protein, which is predicted to disrupt a potential phosphorylation site. The IKBKAP nucleic acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IKBKAP sequence was not shown in the specification, but was derived from the human wild-type IKBKAP sequence given in Fig 6
                                                                                                                                                             New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or

Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides

Gusella JF;

```
The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens and related species; to study polymorphisms, for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms, for gene analysis and for detection/dentification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that casponse or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes proteins, vectors containing the genes and bare also useful therapeutically (to treat microbial infection by bacteria or fungithat are sensitive to P. luminescens and the proteins are as virulence factors and for identifying targets of human diseases for which P. Luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 201 BP; 64 A; 29 C; 48 G; 60 T; 0 U; 0 Other;

The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial

Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms of the denestion/identification of the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that companies or modulate, regulate, induce or inhibit expression of the genes in plants, animals or mirroorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. C. Transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes in production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes in production of the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. c. sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and so biocontrol agents for plants. The present sequence represents DNA encoding an A. baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Drosophila melanogaster expressed polynucleotide SEQ ID NO 13352.

The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are probes and primers for detecting the genome of P. Luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms encoded by the genes are used for detection/identification of the genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful
                                                                                                                                                                                                                                                                             ò

The invention relates to identifying (M1) a candidate p53 pathway modulating agent, by contacting an assay system comprising a purified HW polypeptide (human orthologue of genes that modify the p53 pathway in Drosophila) or nucleic acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference activity, and detecting a test agent-biased activity of the assay system. Also included are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HW polypeptide comprising and maino acid sequence, where p53 function is restored), modulating (M3) a p53 pathway in a mammalian cell (comprising contacting the cell with an agent that specifically binds an HW polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising: (a) obtaining a biological sample from the patient; (b) contacting the sample with a probe for HM
therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ss; gene; p53 modifier; cytostatic; cancer; cytostatic; antiatopotic; p53 pathway; breast cancer; colon cancer; kidney cancer; lung cancer; overian cancer; anglogenesis; cell cycle; apoptotic disorder; cell proliferation disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying mcdulators of the p53 pathway for use in treating apoptotic or cell proliferation disorders, comprises screening for agents that modulate activity of a human ortholog of genes that modify the p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Funke RP;

expression; (c) comparing the results with a control; and (d) determining whether the comparison indicates a likelihood disease). (M1) is useful for disadiators of the p53 pathway. A probe for HM expression is useful for disagnosing breast, colon, kidney, lung and ovarian cancer. In a patient, where the cancer has greater than 25 % expression level. Modulators identified by (M1) are useful in a variety of disagnostic and therapeutic applications, where disease or disorder prognosis is related to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell corproliferation disorders (e.g. cancer). Another two new methods (M2 and M3) are useful for modulating the p53 pathway off a cell, thus restoring the p53 function of the cell, so that the cell undergoes normal proliferation or progression through the cell (M2) and (M3) are also useful for treating defects in the p53 pathway such as angiogenic, apoptotic or cell proliferation disorders. The present sequence is an HM coleic acid encoding a p53 pathway modifying protein

The specificiation describes proteins related to neutralisation and infection prevention of Chrysophrys major iridovirus. The protein encoded by the DNA is useful as an antigen for preventing infection of Chrysophrys major iridovirus. The present sequence represents the nucleotide sequence of the Ehhme-1 strain of Red sea bream iridoviris (RSIV). (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pentatricopeptide sequence; PPR sequence; ppr-A; ppr-B; ppr-C;

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a cutoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using that that results in a gene expression of at least 60% of or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of a least 60% of the genes for targeting in the treatment of rheumatoid arthritis; in a mammal conter than a mouse; diagnosis of the mouse; diagnosis of the material arthritis; and reducing the symptoms associated with collagentationed arthritis, and reducing the symptoms associated with collagentingued arthritis; and reducing the symptoms associated with collagentingue and compositions of the present invention are useful for the methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as the mumune disease caused by an infectious agent. This polymulesotide commune disease caused by an infectious agent. This sequence is not shown in the specification. It has been supplied in an electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    r protein, male sterile plant; viable pollen production;

                                                                                                                                                                                                                                                                                                                               The present sequence represents bacterial artificial chromosome (BAC)-64. This BAC contains the Rfo locus, which contains pencatricopeptide (PPR) sequences. The specification describes PPR sequences, designated ppr.A, ppr.B and ppr.C. These PPR sequences are able to restore male fertility in plant. PPR sequences, used singly or in combination, are used to restore male fertility in Brassica, specifically B. napus, that contain a cytoplasmic inducer of male sterility. The plants with restored fertility are used to the back of the plants with restored fertility are used for production of hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 127432 BP; 42300 A; 21940 C; 21537 G; 40004 T; 0 U; 1651 Other;

                                                                                                                                             ò
                                                                                                                                                                                                                          ö
                                               The invention comprises the amino acid and coding sequences of isolated fertility restorer proteins. The DNA and protein sequences of the invention are useful for restoring fertility in male sterile plants, such as Brassica napus plants. The DNA and protein sequences of the invention are useful for increasing production of viable pollen in a plant. The DNA and protein sequences are also useful as selection markers to identify transformed plant cells. The present genomic DNA sequence contains coding sequences for fertility restorer proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for using a plant male-fertility restorer as a marker for transformation. Using a plant male-fertility restorer as a marker for transformation comprises: providing an expression cassette for a male fertility restorer; transforming cytoplasmic male sterile plants with the expression cassette; and fadentifying plants from seep (2) that form seeds when self-pollinated. The male fertility restorer is a radial Rfo or a perunia Rf. The plant is Brassica napus. The expression cassette is covalently linked to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Using a plant male-fertility restorer as a marker for transformation by providing an expression cassette encoding a plant male fertility restorer and transforming cytoplasmic male sterile plant cells with the expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADCB-7618-ADC87623 represent polynucleotide sequences related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; GPCR; guanosine triphosphate-binding protein coupled receptor;
sequence of interest. The expression cassette is co-transformed into the plant cells with a nucleotide sequence of interest. The method is useful for using a plant male-fertility restorer as a marker for transformation. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynuclectide, useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 349981 BP; 100900 A; 78560 C; 77396 G; 92823 T; 0 U; 302 Other;

The nucleic acid inhibits proliferation of a cell. Also included are of the nucleic acid inhibits proliferation of a cell. Also included are of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene product or that has an activity against a biological pathway in which a proliferation required gene or its gene product is consultant in a cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compund's activity; (1) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compund; activity; (11) a culture comprising strains in which the strains is present in a culture or collection of an organism. The target of a compound that inhibite the proliferation of an organism. The compound that inhibite the proliferation of an organism. The nucleic acids are useful for identifying proteins or for screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, contraction of an organism. The present sequence is one of the target provery programs, or for screening to the requence data for this patent did provery differation in cells other than S. aureus, S. typhimurium, a prover of the prime of the present of the present of the present of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid comprising any

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel genes (AAI99926-AAI97963) expressed in human neuroblastoma. The nucleic acids are applicable as a probe or primer in diagnosing the prognosis of human neuroblastoma, malignancy and susceptibility indicators or tumour markers for anti-cancer agents. The gene information for diagnosing prognosis is related to factors similar to that for N-myc and TrkA genes
                                                                                                                                                                                                                                                                                              Human; neuroblastoma; malignancy; cancer; tumour marker; N-myc; TrkA; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids originating in gene expressed in human neuroblastoma, useful as probe or primer in diagnosing prognosis of human neuroblastoma, malignancy and susceptibility indicator or tumor marker for anti-cancer

Petunia PEIL3 nucleic acid sequence.

```
The present invention describes primer sets for synthesising 5602 full-

[a] an oligo-dr primer and an oligonaclectide complementary to the

[c] an oligo-dr primer and an oligonaclectide complementary to the

[c] complementary strand of a polynuclectide which comprises one of the 5602

[a] an oligonaclectide comprises at least 15 nuclectides; or (b) a combination

[c] complementary strand of a polynuclectide which comprises a 5'-end

[c] complementary strand of a polynuclectide which comprises a 5'-end

[c] sequence and an oligonaclectide complementary to the

[c] complementary strand of a polynuclectide which comprises a 5'-end

[c] sequence and an oligonaclectide comprising a sequence complementary to a

[c] polynuclectide which comprises at least 15 nuclectides and the combination of

[c] plynuclectide which comprises at least 15 nuclectides and the combination of

[c] che 5'-end sequence 5'-end sequence is selected from those defined in the

[c] specification. The primer sets can be used in antisense therapy and in

[c] specification. The primers are useful for synthesising polynuclectides,

[c] particularly full-length cDNAs. The primers are also useful for the

[c] che full-length cDNAs. The primers are also useful for the

[c] che full-length cDNAs. The primers are also useful for the

[c] che full-length cDNAs. The primers are also useful conforded by

[c] che full-length cDNAs. The primers are also useful conforded by

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers are also washils and

[c] che full-length cDNAs. The primers areal and the proteins encoded by

[c] che full-length cDNAs. The p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

```
This sequence represents the Petunia EIN3-like protein, PEIL3, nucleic acid sequence. This sequence is one of the preferred nucleic acid acid sequence. This sequence is one of the preferred nucleic acid sequence. This sequence is one of the preferred nucleic acid abscission in a transformed, commercially useful plant. The method comprises effecting the overexpression of EIN2 and/or EIN3 in the resulting transgenic plant as compared with a non-transformed wild type plant. Overexpression of the EIN2 gene may be driven with a flower abscission zone-specific promoter, where the overexpressed EIN2 gene has concluded acid sequences are petunia, lettuce, tomato, geranium, begonia, or cotton EIN2. The method is useful for controlling abscission in a transformed, commercially useful for controlling abscission in a transformed, commercially useful plants for the production of source plants, and other commercially useful plants for the production of the source plants, and other commercially useful plants for the production of source plants, and other commercially useful plants for the production of the source plants, and other commercially useful plants for the production of source plants, and other commercially useful plants for the production of the source longevity, and for reducing flower abscission. The petunia EIN3 constitutive CAMV 35s promoter. One of the genes, PEIL2, was also orerexpressed under the control of the CAMV 35s promoter. Over 70 constitutive CAMV 35s promoter. Only plants that were constitutive performed for each construct. Only plants that were constructed for each constructed for each onstructed for each pad no effect. Advas after pollination compared to 1.5 days and one had no effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

The present invention relates to novel plant transcription factors from Bucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the binding families of regulatory proteins: bZIP, bZIP family of G-box homeotic/homeodomain/homeobox/MADS, homeodomain zipper, LIM domain, AP2 and BREBS, zinc finger domains of type 2 CysZHis2, CCAAT box elements and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human secreted protein-encoding gene 4 cDNA clone HAGEB14, SEQ ID NO:27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EXTXPX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

[a] an oligo-dT primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
culgonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide with comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
soquence and an oligonucleotide comprises a sequence complementary to a
polynucleotide which comprises a 1 east 15 nucleotides and the combination of
the 5'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
specification. The primers set useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
cDNAs easily without any specialised methods. AAH3633 to AAH3638 and
AAH3633 to AAH38742 represent human cDNA sequences; AAB92446 to AAB95893
represent human amino acid sequences; and AAH13629 to AAH3632 represent
oligonucleotides, all of which are used in the exemplification of the
present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó

ANDOT770-AAD07794 represent cDNAs corresponding to 10 human secreted protein genes, and AAE03178-AAE03402 represent the proteins they encode. C protein genes, and AAE03178-AAE03402 represent the protein step encode. C protein genes, and AAE03178-AAE03402 represent they encode. C The secreted proteins and their genes are useful for preventing, treating cor ameliorating medical conditions, e.g., by protein or gene therapy. C bathological conditions can be diagnosed by determining the amount of the new genes. Specific uses are described for each of the 10 genes, the new genes. Specific uses are described for each of the 10 genes, con the itssues in which they are most highly expressed, and include devoloping products for the diagnosis or treatment of proliferative disorders, diseases of the immune system, AIDS, autoimmune consortive disorders, diseases of the immune system, AIDS, autoimmune disorders (e.g., rheumatoid archritis), inflammation, allergies, cognitive disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, atherosales, sathma, skin disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proteins can also be used to aid wound healing and epithelial cell proteins can also be used to aid wound healing and epithelial cell proteins can also be used to aid wound healing and epithelial cell proteins can also modify storage properties. Although symptoms associated protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The

16-JUL-2002 (first entry)

Human secreted protein-encoding gene 2 cDNA clone HGBAR55, SEQ ID NO:12.

Human; secreted protein; immunodeficiency; inflammation; septic shock; reperfusion injury; inflammatory bowel disease; autoimmune disorder; rheumatoid arthritis; gastrointestinal disorder; respiratory disorder; asthma; allergy; cancer; multiple sclerosis; cardiovascular disorder; neurodegenerative disorder; Parkinson's disease; Alzheimer's disease; atherosclerosis; acquired immune deficiency syndrome; prion disease; ALDS-related dementia; hepatitis; blood-related disorder; prion disease; hyperproliferative disorder; renal disorder; acute glomerulonephritis; endocrine disorder; Addison's disease; reproductive system disorder; acute glomerulonephritis; endocrine disorder; infectious disease; pancreatic disorder; gene therapy; vaccine; gene;

Homo sapiens.

"Human secreted protein precursor" product= "Human mature secreted protein" Rosen CA, Komatsoulis GA, Baker KP, Birse CE, Olsen HS, Moore PA, Wei P, Ebner R, Duan DR, Fiscella M, Ni J; ocation/Qualifiers 17-JAN-2001; 2001WO-US001396. 18-AUG-2000; 2000US-0226280P. 21-DEC-2000; 2000US-0256968P. /*tag= a /product= "H1 1645. .1749 HUMA-) HUMAN GENOME SCI INC .1893 *tag= *tag= .750. WPI; 2002-315464/35. P-PSDB; AAE21630. for therapeutic use. WO200216576-A1 28-FEB-2002. sig_peptide mat peptide AAD34068-AAD34096 represent cDNAs corresponding to 11 human secreted process, and AAE21657 represent the proteins they encode.

AAE21658-AAE21663 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or amelicating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the underloop in the invention are useful in treating, preventing diagnosing and/or prognosing immunodeficiencies, inflammatory conditions (e.g., septic shock, reperfusion injury, inflammatory conditions (e.g., septic shock, reperfusion injury, inflammatory conditions (e.g., respiratory diagnosing immunodeficiencies, inflammatory conditions (e.g., breast), cardara nervous system (CNS) disorders (e.g., multiple of breast), cardara nervous system (CNS) disorders (e.g., multiple sclenosis), cardiovascular disorders (e.g., atherosofierosis), neuro-conditions and disorders (e.g., ather are characterised by inflammator of desease), and many additional disease, AIDS-related dementia, prion disease) and many additional diseases, and pancreatis dementia, prion disease) and many additional disease, accorditions and disorders (e.g., endometriosis), infectious disease), reproductive system disorders (e.g., endometriosis), infectious disease), reproductive system disorders (e.g., endometriosis), infectious disease, and man-pace immune responses, anti-viral, anti-bacterial, anti-fungal and anti-parasitic immune responses, anti-viral, anti-bacterial, and anti-planasitic immune responses. Secreted processes and anti-planasitic immune and to components. Sequences of the invention are also useful in gene therapy. The present sequence represents a human secreted protein-encoding cDNA of mammalian characteristics such as body height, weight, hair colour and tinorease or decrease storage capabilities, fat content, lipid, protein, vitamins, carbohydrate, minerals, coffactors or other nutritional components. Sequences of the invention are also useful in gene therapy.

Human secreted polypeptides and polynucleotides for diagnosing, prognosing, preventing and treating immune, hyperproliferative, liver, kidney, and reproductive disorders and for identifying their modulators

Soppet DR; Shi Y, Choi GH;

Claim 1; Page 404-405; 462pp; English.

ADD14068-AAD34096 represent cDNAs corresponding to 11 human secreted protein genes, and AAE21629-AAE21657 represent the proteins they encode. AAE21689-AAE21661 represent human secreted protein stagements. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the presence of the through of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the conditions in the new genes. Specific uses are described for each of the conditions in the new genes. Specific uses are described for each of the conditions in the new genes. Specific uses are most highly expressed. Sequences of the invention are useful in treating, preventing, diagnosing and/or prognosing immunodeficiencies, inflammatory conditions (e.g., septic shock, repertusion injury, inflammatory bowel disease), autoimmune disorders (e.g., asthma and allergy), cancers (e.g., inventions disorders (e.g., asthma and allergy), cancers (e.g., inventions of degenerative disorders (e.g., asthma and allergy), cancers (e.g., inventions and disorders that are characterised by inflammation (e.g., ADS-related dementia, prion disease) and many additional disease, conditions and disorders that are characterised by inflammation (e.g., theomosis), hyperprolificative disorders (e.g., Addison's disease) and pancreatic disorders (e.g., Addison's disease) and pancreatic disorders. They are also useful as vaccine adjuvants that container system disorders (e.g., Addison's disease) and anthere immune responsiveness to an antigen and as adjuvants to enhance tumune responsiveness. Secreted proteins of the invention are used for enhancing or inhibiting complement mediated cell lysis, for prevent hair less the streamland or treat, prevent secreted proteins of the are to ethancially and disorders. They are also useful and secreted proteins of the are used for prevent hair loss, to stimulate keratinocyte growth, to modulate mammalian characteristics such as body height, weight, hair colour and to increase or decrease storage capabilities, fat concent, lipid, protein, vitamins, carbohydrate, minerals, cofactors or other nutritional components. Sequences of the invention are also useful in gene therapy. The present sequence represents a human secreted protein-encoding cDNA of

Drotein genes, and AALLIDY-AARLISE, Tepresent Lies proteins or gene and their corresponding secreted proteins fragments. The genes treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount to the new protein in a sample or by determining the presence of mount to the new protein in a sample or by determining the presence of mount to the new protein in a sample or by determining the presence of emount to the new protein are useful in treating, preventing, diagnosing and/or prognosing immunodeficiencies, inflammatory conditions (e.g., septic shock, reperfusion are useful in treating, preventing, diagnosing and/or prognosing immunodeficiencies, inflammatory conditions (e.g., septic shock, reperfusion injury, inflammatory conditions (e.g., respiratory disorders (e.g., asthma and allergy), cancers (e.g., rheumatoid asthmatical disorders, central nervous system (CRS) disorders (e.g., multiple colerosis), produces that are characterised by inflammation (e.g., ADS-realated dementia, prion disease) and many additional disease.

ADS-related dementia, prion disease) and many additional disease, conditions and disorders that are characterised by inflammation (e.g., therembosis), hyperproliferative disorders, renal disorders (e.g., thrombosis), hyperproliferative disorders, renal disorders (e.g., additional disease) and pancreatic disorders. They are also useful as vaccine adjuvants that corporative system disorders (e.g., additional disorders (e.g., additional disorders. They are also useful as vaccine adjuvants that the parasitic immune responses. Secreted proteins of the invention and are used to trense, prevent and/or dispose neuronal damage, to growth and are used to trense, prevent and/or dispose every prevent and disease storage capab

Nucleic acids encoding 3224 human nervous system antigen polypeptides,

```
The invention relates to novel genes (ABA11004-ABA1534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating considerations e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the nucleic acids, proteins, antibodies and (ant) agonists are useful in the nucleic acids, proteins, antibodies and (ant) agonists are useful in preast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases such as wiral, bacterial, fungal and parsaitic infections diseases such as viral, bacterial, fungal and parsaitic the printed specification, but was obtained in electronic form tirectly from MIPO at ftp.Wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker, pharmacogenomic marker, gene; ss.
useful for preventing, diagnosing and/or treating nervous system cancers

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is a sfllicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.

Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.

Disclosure; SEQ ID NO 19563; 106pp; English.

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. noncanciant cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that ealectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to calls of the patient an antisense oligonuclectide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed cancer is assessed by detecting the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein ADL45673

٦. ن

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequence (ABL16175) and the encoded proteins (ABBL30737-ABB22072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly

Claim 1; SEQ ID NO 7922; 21pp + Sequence Listing; English.

```
fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting appression of the marker in a patient sample at a first point in time, repeating the method at a subsequent using and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                           ;

The present invention describes the use of irinotecan (1) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine cytostatic activity. The therapeutic applications of (1) is improved, since it is possible to individually treat a subject with an appropriate charmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM36013 represent sequences used in the

The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) allele which comprises a multidrug resistance protein 1 (MRP1) can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 183610 BP; 50187 A; 43907 C; 42684 G; 45427 T; 0 U; 1405 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAl gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAL gene. The invention has cytostatic activity. A composition of the invention acts as an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 183610 BP; 50187 A; 43907 C; 42684 G; 45427 T; 0 U; 1405 Other;

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDRI) polymotlectide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the

The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This sequence encodes a Klebsiella pneumoniae polypeptide of the invention
                                                                                                               The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having agenome with a variant allele which comprises a multidurg resistance I (MDRI) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
           New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                           Sequence 183610 BP; 50187 A; 43907 C; 42684 G; 45427 T; 0 U; 1405 Other;

the present sequence represents an isolated polynucleotide sequence (I) from the present invention, which encodes a polypeptide (II) with biological activity. Also described: (I) a vector comprising (I); (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) an antibody directed against the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4); (7) detecting (I) or the polypeptide of (4); (9) producing the polypeptide of (4); and (10) a collection of polypeptide of (4); and (10) a collection of collection of polypeptides comprising at least one of the polymoclectides sequences (I). The polymucleotides (I) can be used as hybridisation probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal actionmas and cancers. AAH37196 to AAH37204 and AAB7778 represent sequences used in the exemplification of the present invention. N. B. Human, probe, ss, gene expression, single exon probe, microarray, alternative splicing event, genomic alteration. Hanzel DK; 03-APR-2002; 2002US-00029386. 3-APR-2002; 2002US-00029386 (PENN/) PENN S G. (RANK/) RANK D R. (HANZ/) HANZEL D K. Penn SG, Rank DR, JS2003194704-A1 Homo sapiens.

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

WPI; 2004-119264/12.

Claim 15; SEQ ID NO 5745; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification. The probe is a single exon probe that encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially.

Comprising a plurality of single exon nucleic acid human compared by the single exon nucleic acid probes cited above where each of the plurality of probes is separately and addressably isolatable or amplifable from the plurality, a single exon microarray for measuring human gene expression, a vector comprising the single exon contiguous amino acids of any of the above- mentioned amino acid or probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above- mentioned amino acid or sequences (Optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of probes or microarrays to a customer desiring to measure gene expression of a single exon probe cited above. The probes may be used as tools for surveying correct including data on the expression of a single exon microarrays. Corrage medium which contains a database having a plurality of records expression analysis. The probes may be used as tools for surveying expression analysis. The probes may be used as tools for surveying expression analysis. The probes may be used as tools for surveying content or an expression and the probes are used in identifying and characterising groos alterations in the genomic locus that includes their exon, in assessing callerations in the genomic cloud peptide. The present sequence is a human stand and probes are the printed specification, but was obtained seqdata.uspto.gov/sequence.html?DocID=20030194704 lectronic format directly form part of did not

Drmanac Tang YT, Liu C,

2001-457740/49. P-PSDB; ABB12022 Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer.

Claim 1; Page 873; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host calls comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides of producing the novel polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may consider the properties of the invention may consider the properties of the invention may have various activities; including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; characteristic or chemokinetic activity; activin. or inhibin related activities; characteristic activities; haemostatic, thrombotic or chemokinetic activities; haemostatic, thrombotic or the invention are useful for preventing, treating or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell clasorders), chronic inflammatory conditions (e.g., asthma or arthritis), ABA09266

Greenspan RJ;

WPI; 2001-356159/37.

New isolated nucleic acid having mammalian vestibular system-modulating activity useful in the treatment of disorders such as motion sickness and vertigo.

Claim 59; Page 114; 179pp; English.

The sequences shown in AASO5401-AASO5661 represent DNA with mammalian vestibular system-modulating activity. The DNA sequences can be used in a method whereby a first and second strain of an invertebrate is obtained, and both are subjected to conditions in which the strains exhibit different geotactic behaviour. Genes that are differentially expressed in the first strain relative to the second strain are then identified. Mammalian genes having substantially the same nucleic acid sequence as these modulate the mammalian vestibular system. Compounds containing

```
The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. Luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. Luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. Luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Luminescens. Cells transformed to express the genes are useful for response or sensitivity to toxins and antibiotics produced by P. Luminescens. Cells transformed to express the genes are useful for response or sensitivity to toxins particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that the sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibacterial, fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague; whooping cough; gene; ds.
these genes are used to decrease the symptoms of graviperceptive disorders such as motion sickness, vertigo, labyrinthitis, Meniere's disease, acoustic neuroma, multiple sclerosis, syphilis, trauma, infection of the middle ear, exposure to ototoxic agents and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.
                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Danchin A;
